

From Raw Data to Strategic Clarity

An Interactive Analysis of the Mobile
Sales Market Using Power BI

Power BI

The Challenge: Navigating a Complex Market with Unclear Data

In the competitive mobile phone market, success depends on a deep understanding of sales patterns, product performance, and customer behaviour. Without a centralised analytical tool, key strategic questions remained unanswered:

What is our overall sales performance and which products are the true revenue drivers?

Where are our key geographic markets and how are they performing?

How do our customers prefer to pay, and what does this reveal about their behaviour?

What is the overall sentiment of our customers based on their ratings?

The Solution: An Integrated Dashboard for Actionable Insights

To address these challenges, an interactive Power BI dashboard was developed. It consolidates disparate sales data into a single, intuitive interface, providing a complete picture of business performance and customer activity.

The Big Picture: A Market Valued at Rs 769M Across 19K Units

Rs 769M

TOTAL SALES

19K

TOTAL QUANTITY SOLD

Rs 40K

AVERAGE PRICE PER UNIT

The analysis immediately quantified the scale of the market, establishing a baseline for all further investigation.

Four Key Models Command Over 80% of the Market

Analysis of top-selling models reveals a highly concentrated market. The iPhone SE and Galaxy S21 lead, each capturing 21% of sales, followed closely by the Galaxy Note 20 and OnePlus Nord.

UPI Emerges as the Dominant Digital Payment Method

The payment landscape is evenly split, but UPI's slight lead at 26% signals a critical shift in consumer preference towards digital wallets. Cash remains a strong contender at 25%, with card payments just behind.

Customer Sentiment is Overwhelmingly Positive

Feedback analysis shows that a majority of customers (51%) rate their experience as “Good”. This provides a strong foundation for brand loyalty, while also identifying a significant segment for potential improvement.

Sales are Concentrated in Major Metropolitan Hubs

The dashboard provides city-level insights, confirming that sales activity is highest in key urban centres. This enables targeted marketing campaigns and optimised regional resource allocation. Analysis covers major cities including Delhi, Mumbai, Chennai, Hyderabad, Indore, and Kolkata.

Monthly and Daily Trends Reveal Critical Sales Rhythms

The dashboard tracks performance over time, showing monthly quantity variations from January to December and day-wise sales patterns. This helps identify peak buying periods, inform inventory management, and schedule promotional activities effectively.

Monthly Quantity Trends

Day-wise Sales Patterns

The Technical Architecture: Tools and Techniques

The project was executed using a standard business intelligence workflow, from data preparation to final visualisation.

Platform

Power BI Desktop

Data Engine

DAX (Data Analysis Expressions) for creating robust custom measures.

Foundation

Data Cleaning & Modelling to ensure data integrity and build efficient relationships.

Storytelling

Visualisations including Bar Charts, Maps, Pie Charts, and Cards to communicate insights clearly.

A Complete Demonstration of End-to-End BI Capability

This mobile sales project showcases the ability to translate a complex business need into a robust, insightful, and user-friendly intelligence tool. It demonstrates proficiency in:

- Connecting business questions to data-driven solutions.
- Implementing technical skills in data modelling, DAX, and visualisation.
- Extracting and communicating clear, actionable insights through effective data storytelling.
